

B2B Hyderabad V2 — Frozen Requirements Specification

Frozen Requirements Set 01 | Status: FROZEN

This specification records the agreed frozen requirements for the new b2btravelv2 project. Each numbered set is appended after agreement and remains subject to change control.

Frozen Requirements Set 01

FR-01 Landing page and 8D Presence

Status: FROZEN. The landing page shall communicate the application’s actual purpose through a clear blue-sky visual identity. “8D Presence” is the project’s design term for a cinematic spatial experience built with layered depth, parallax, perspective, atmospheric motion, and responsive interactions. Motion shall be choreographed to support comprehension and usability, remain performant on mobile devices, and respect reduced-motion preferences. The final tagline is TBD and is not frozen in this set.

FR-02 Distinct landing actions and access

Status: FROZEN. The landing page shall provide two distinct actions. “Join the Network” shall lead to registration and onboarding, followed by the authenticated dashboard. “Explore Businesses” shall lead to public business discovery without requiring login. When a visitor attempts a protected B2B action, the application shall require authentication before that action proceeds.

FR-03 Persistent Market and Country Context

Status: FROZEN. A user shall select a Market/Country Context before or at marketplace entry. The selected context shall persist during use and be shown in a visible switcher. It shall influence the businesses, services, packages, currency, and service availability presented to the user. The dashboard shall provide useful marketplace functionality beyond country selection.

FR-04 Service verticals and business identity

Status: FROZEN. The platform shall have three top-level service verticals: Tourism, Hajj & Umrah, and Visa Services. Business identity shall be modeled separately from service verticals so that one business can participate in multiple verticals. Currently supported business types are Travel Agency, Tour Operator, and Destination Management Company (DMC). Other business types will be defined in later requirement sets.

Frozen Architecture Relationship

Market → Service Vertical → Businesses → B2B Products/Services

This relationship describes discovery and navigation. Business identity remains independent of service-vertical membership, as specified in FR-04.

Frozen Requirements Set 02

Status: FROZEN. Users, business types, approval lifecycle, permissions, and access principles.

FR-05 Super Admin

Status: FROZEN. Super Admin is the highest application governance role. The authorization architecture shall reserve this role for platform ownership, administrator and role management, and platform-level control, even if its full interface is implemented later.

FR-06 Admin authority

Status: FROZEN. Admins shall review network applications; approve, reject, or request information; moderate marketplace content; and perform defined platform administration. Admins shall not impersonate businesses or carry out commercial actions on their behalf.

FR-07 Business User and business types

Status: FROZEN. Business User is one application role. Travel Agency, Tour Operator, and Destination Management Company (DMC) are business types, not authentication roles.

FR-08 Guest discovery

Status: FROZEN. Guests may explore permitted public marketplace information without registering. Protected B2B actions shall trigger the applicable registration, authentication, and approval checks.

FR-09 Applicant state

Status: FROZEN. Applicant is an account or business membership state, not a permanent application role. Applicants may access their application and status while awaiting a decision.

FR-10 Business membership lifecycle

Status: FROZEN. Business applications shall support Draft, Submitted, Under Review, Approved, Request Information, and Rejected states. A business that has been approved may subsequently be Suspended. Requested information may be supplied and the application resubmitted for review.

FR-11 Authentication and authorization

Status: FROZEN. Authentication establishes user identity; business approval establishes marketplace participation rights. Authentication alone shall not authorize protected B2B activity.

FR-12 Protected business actions

Status: FROZEN. Only an authenticated user acting for an approved business may perform protected B2B actions, including publishing marketplace offerings and platform messaging.

FR-13 Business offerings

Status: FROZEN. Approved businesses may create Packages, Services, and Offers. Their detailed definitions and data schemas are deferred to later requirement sets.

FR-14 Business discovery and messaging

Status: FROZEN. Approved businesses may discover other businesses and their public marketplace offerings and communicate with other businesses through platform messaging.

FR-15 Separate geographic concepts

Status: FROZEN. Business Location, Service or Destination Location, and Source or Target Market shall be represented separately. A business may be located in one country while offering a service in another and targeting a third market.

FR-16 Application status notifications

Status: FROZEN. Application status changes shall generate in-platform, email, and registered-mobile notifications. Delivery providers and technology will be decided later.

FR-17 Engineering access

Status: FROZEN. Tech Support and Developer access to the repository and engineering systems shall be managed separately from application roles and permissions. No web application role shall grant source-code access.

FR-18 Administrative auditability

Status: FROZEN. Privileged administrative actions shall produce an auditable record.

FR-19 Deferred detail

Status: FROZEN. Detailed permission rules, registration fields, Package, Service and Offer schemas, and messaging rules shall be defined in subsequent requirement sets.

Frozen Requirements Set 03

Status: FROZEN. Availability-aware B2B marketplace, calendar discovery, geographic matching, and filter architecture.

FR-20 Availability-aware discovery

Status: FROZEN. The marketplace shall support discovery of relevant businesses, packages, and services using the business requirement: what is needed, where it is needed, when it is needed, for whom, and under which commercial conditions. Search shall account for availability rather than acting only as a static business directory.

FR-21 Calendar and date filtering

Status: FROZEN. Tourism and Hajj & Umrah discovery shall support calendar or date-based filtering for travel or service availability. Changing selected dates shall update relevant marketplace results. A visual calendar interface shall expose available, on-request, and unavailable states when the underlying supplier data supports them.

FR-22 Vertical-specific search

Status: FROZEN. The three service verticals shall use a shared filtering architecture with fields appropriate to each vertical. Tourism and Hajj & Umrah shall have travel or service date discovery, while Visa Services shall treat dates primarily as intended travel dates and processing requirements. Hajj & Umrah shall not be treated as Tourism with only a category checkbox.

FR-23 Supplier availability data

Status: FROZEN. Businesses creating packages or services shall be able to declare structured availability, including fixed dates, date ranges, recurring or year-round availability, and availability on request. The data architecture shall accommodate exceptions and capacity where relevant; the exact creation fields and initial release scope will be specified later.

FR-24 Independent geographic matching

Status: FROZEN. Marketplace matching shall distinguish business location, source or target market, departure or origin, and service or destination location. A provider may be shown for a relevant search regardless of where that provider is based, subject to the selected market and offering data.

FR-25 Search context continuity

Status: FROZEN. The marketplace shall preserve the selected market and search filters when a user opens a business or offering and returns to results. Business and offering pages may show how an item matches the active search context.

FR-26 Progressive filtering interface

Status: FROZEN. The primary search shall surface the most important fields for the selected vertical, with further filters available through an advanced or More Filters control. The interface shall not present every possible filter at once.

FR-27 Visa result claims

Status: FROZEN. Visa search and provider availability shall not imply guaranteed government or consular approval or guaranteed processing dates.

FR-28 Deferred filter detail

Status: FROZEN. Exact filter fields, product and availability schemas, result ranking, trust or reputation rules, and release phasing shall be defined in later requirement sets. This set freezes the discovery architecture and calendar concept rather than every advanced filter proposed during planning.

Frozen Requirements Set 04

Status: FROZEN. Platform foundation, authentication, security, availability, and scalability.

FR-29 Concurrent capacity and load testing

Status: FROZEN. The production platform shall support at least 500 concurrent active users under a defined production workload while maintaining acceptable response times and stability. Performance and load testing shall verify this capacity before production release. The architecture shall permit growth beyond this level without a fundamental application redesign.

FR-30 Service availability objective

Status: FROZEN. The production service shall target 99.9% monthly availability, excluding planned maintenance. Availability shall be measured and monitored.

FR-31 Authentication lifecycle and login experience

Status: FROZEN. The application shall provide registration, login, logout, password recovery and reset, verification where required, and session management. Email and password shall be the dependable baseline for Business User login. Login and recovery shall use clear validation, secure expiring recovery tokens, and responses that avoid disclosing whether an account exists. Additional mobile or OTP login may be specified later.

FR-32 State-aware routing after login

Status: FROZEN. After login, an applicant shall be directed to application status and any requested corrections; an approved Business User to the business dashboard; and an Admin to the administration interface. Suspended or rejected states shall receive appropriate access and status messaging rather than unrestricted business controls.

FR-33 Secure sessions

Status: FROZEN. Authentication shall use a secure server-managed session lifecycle. Sessions shall expire and support revocation; logout shall invalidate the relevant session. Session security shall include secure cookie settings and CSRF protection where applicable. Account suspension or a security event shall be able to revoke access.

FR-34 Multi-factor authentication

Status: FROZEN. Multi-factor authentication shall be mandatory for Admin and Super Admin accounts. It may initially be optional for Business Users, while the architecture shall allow stronger requirements later.

FR-35 Backend authorization

Status: FROZEN. Every protected backend operation shall enforce the applicable role, business approval state, ownership or record-level access, and action permission. Frontend visibility of controls shall not be treated as authorization.

FR-36 Transactional data and search

Status: FROZEN. PostgreSQL shall be the primary transactional database. The data layer shall support migrations, referential integrity, appropriate indexes, pagination, transactions for critical multi-step operations, and connection pooling. Marketplace filtering and availability search shall use indexed server-side queries and pagination rather than downloading all records for client-side filtering.

FR-37 Secure file handling

Status: FROZEN. Uploaded assets and private documents shall be stored in suitable object storage with database references. Uploads shall be subject to type and size validation; private files shall require authorization and shall not be publicly enumerable. Additional controls such as malware scanning and time-limited access shall be applied where appropriate.

FR-38 API and secret security

Status: FROZEN. Backend APIs shall validate input and business rules, enforce authentication and authorization, and protect against common injection and browser attacks. The platform shall use appropriate request-size limits, HTTP security settings, and cross-origin controls. Secrets and sensitive configuration shall remain outside frontend bundles.

FR-39 Rate limiting and abuse protection

Status: FROZEN. Authentication, password recovery, messaging, uploads, and public marketplace endpoints shall have operation-appropriate rate limits and abuse protection. Exact thresholds shall be set during implementation and performance testing.

FR-40 Audit records

Status: FROZEN. Important administrative and security actions shall create audit records identifying the actor, action, resource, time, and outcome. Ordinary users shall not be able to alter audit records.

FR-41 Observability and health checks

Status: FROZEN. Production shall provide application and error logs, performance and database monitoring, job or queue monitoring, and security-event visibility. Operational health checks shall report the state of the API and critical dependencies sufficiently for monitoring and deployment decisions.

FR-42 Backups and recovery

Status: FROZEN. The platform shall have automated database backups, defined retention, a documented restore process, periodic restore testing, and deployment rollback capability. Production migrations shall consider recovery. Exact recovery objectives shall be defined later.

FR-43 Environment separation

Status: FROZEN. Development, staging, and production shall use separated configuration and data. Staging shall permit end-to-end validation of core workflows before production deployment; development and testing shall not operate on the production database.

FR-44 Modular and horizontally scalable backend

Status: FROZEN. The backend shall use a modular-monolith architecture with clear capability boundaries. Application instances shall be stateless where practical so the API can scale horizontally without rewriting business logic. Supporting cache or queue infrastructure shall be introduced where justified.

FR-45 Failure isolation and graceful degradation

Status: FROZEN. Failure of messaging, email, mobile notifications, or another non-core supporting capability shall not prevent unrelated marketplace or business-management operations wherever technically feasible. Failed asynchronous work shall be recorded, monitored, and retried where appropriate; failures shall remain visible to operators.

FR-46 MVP business account model

Status: FROZEN. MVP shall support one primary approved Business Owner account per Business. User and Business shall remain separate entities so future releases can support multiple staff accounts for one Business without redesigning the core business data model. Staff invitations, staff roles, and team management are deferred.

Frozen Requirements Set 05

Status: FROZEN. Hajj & Umrah MVP functional requirements.

F01 Business Registration and Verification

FR-47 Registration information

Status: FROZEN. A multi-step network application shall capture the owner identity; legal and trading business names; business type; registered address and country, state, and city; email and mobile contacts; optional website; years in operation; Hajj & Umrah capabilities; source markets; Saudi service destinations; registration or licence information; and supporting documents.

FR-48 Registration flow

Status: FROZEN. Applicants shall be able to save and continue an application, see progress and step validation, upload documents, preview the completed application, and submit it. Email and mobile contact verification shall be completed before final submission.

FR-49 Document requirements

Status: FROZEN. The application shall support business registration or licence documents and other supporting material. Which documents are required shall be configurable by market and business type rather than permanently hard-coded.

FR-50 Review and correction

Status: FROZEN. Admin shall be able to view the application summary, full details, documents, verification status, internal notes, and review history, then approve, request information, or reject. The applicant shall be able to correct requested information and resubmit.

FR-51 Approval versus external accreditation

Status: FROZEN. B2B Hyderabad approval shall mean only that the platform approved the business for its network. Relevant Saudi authorization, provider, external-agent, or licence information may be recorded separately, but platform approval shall never be presented as government accreditation.

F02 Business Profile and Trust

FR-52 Authoritative business profile

Status: FROZEN. Each approved business shall have one authoritative profile with its logo, name, type, description, headquarters, contact channels, years operating, languages, markets served, Hajj & Umrah capabilities, service locations, approval status, and marketplace offerings.

FR-53 Profile geography and trust

Status: FROZEN. A profile shall distinguish business location, source markets, service countries, and service cities. “B2B Hyderabad Approved Business” shall identify platform approval only; any external licence or accreditation shall show its separate issuer or source.

FR-54 Contact visibility

Status: FROZEN. Public visitors shall be able to view a business marketplace profile with limited sensitive contact information. Approved businesses shall receive the richer B2B contact and messaging capabilities allowed by their permissions.

F03 Packages Services Offers and Availability

FR-55 Distinct commercial objects

Status: FROZEN. The MVP shall model Package, Service, and Offer as distinct objects. A Package is a bundled travel product; a Service is an individual capability; an Offer is a promotional or commercial proposition associated with a Package or Service where appropriate.

FR-56 Hajj and Umrah subtypes

Status: FROZEN. Hajj and Umrah shall be distinct subtypes within the shared Hajj & Umrah vertical. Shared infrastructure may be reused, while subtype-specific fields and rules shall remain possible, including future Hajj-specific operational details.

FR-57 Umrah package details

Status: FROZEN. An Umrah package shall capture supplier, name, source market and departure city, destination cities, travel or validity dates, total and Makkah/Madinah nights, traveller or group applicability, accommodation and room occupancy, transport, flights when applicable, meals, visa inclusion or status, ziyarat, guide or assistance, inclusions and exclusions, B2B pricing and currency, availability, cancellation terms, and relevant images or documents.

FR-58 Offering lifecycle

Status: FROZEN. Packages shall support Draft, Published, Paused, and Archived states. The owner shall be able to preview, edit, duplicate, and archive an offering. Draft deletion may be allowed; published historical records should be archived rather than destructively deleted.

FR-59 Availability and capacity

Status: FROZEN. Package and Service availability shall support fixed departures, date ranges, recurrence, year-round operation, and on-request availability, with blackout dates where relevant. Explicit capacity or group-size values shall be optional; suppliers may instead use on-request availability.

FR-60 B2B pricing

Status: FROZEN. Offerings shall support fixed B2B price, starting-from price, and price on request. A currency shall be required whenever a price is displayed.

FR-61 Geographic separation

Status: FROZEN. Every offering shall distinguish the supplier location, source market or departure point, and service destination rather than assuming these are the same place.

FR-62 Custom package request

Status: FROZEN. An approved business shall be able to request a custom Hajj or Umrah package from a selected provider, supplying dates, departure city, group size, nights, and service requirements. The request shall retain its supplier and requirement context for follow-up.

F04 Marketplace Dashboard and Navigation

FR-63 Focused business navigation

Status: FROZEN. The authenticated MVP shall provide Home, Hajj & Umrah Marketplace, Businesses, My Packages & Services, Messages, Notifications, and My Business as its primary business areas. The current market selector shall remain globally accessible.

FR-64 Operational dashboard

Status: FROZEN. The business dashboard shall prioritize marketplace search, current market, active Packages and Services, messages needing attention, application or account notices, recent marketplace activity, and quick creation of a Package or Service.

FR-65 Requirement-oriented search and results

Status: FROZEN. The Hajj & Umrah marketplace search shall use departure or source market, travel dates, traveller or group size, and Hajj or Umrah subtype. Results shall support Packages, Services, and Businesses views under the same preserved search context.

FR-66 Specialized filters

Status: FROZEN. Hajj & Umrah results shall offer relevant filters for dates, departure or source market, Saudi destination or city, trip nights and Makkah/Madinah nights, accommodation and room occupancy, group size, package type, visa inclusion, transport, meals, price and currency, availability, supplier type, and platform approval status.

FR-67 Package comparison

Status: FROZEN. Approved businesses shall be able to shortlist and compare a small number of Hajj or Umrah Packages on core fields including dates, nights, accommodation, transport, visa inclusion, meals, and B2B price.

F05 B2B Messaging and Enquiries

FR-68 Messaging eligibility and context

Status: FROZEN. Only authenticated users acting for approved businesses may initiate or respond to B2B marketplace conversations. A conversation may begin from a Business, Package, Service, Offer, or Custom Package Request and shall retain that context.

FR-69 Messaging functions

Status: FROZEN. The MVP shall support text messages, timestamps, unread state, basic document or image attachments, a conversation list and search, and a contextual reference to the relevant business or offering.

FR-70 Enquiry actions and abuse controls

Status: FROZEN. Relevant marketplace items shall expose Message Supplier and, where appropriate, Enquire or Request Custom Package actions. Messaging shall have rate limits and block or report controls.

FR-71 Messaging isolation

Status: FROZEN. Messaging or notification failures shall not block marketplace discovery, Package management, Business Profile management, or other unrelated core operations.

F06 Administration

FR-72 Admin workspace

Status: FROZEN. The Admin Console shall provide Dashboard, Applications, Businesses, Marketplace, Users, Reports, Audit, and System Health areas. Its dashboard shall surface pending and information-requested applications, approved and suspended businesses, published inventory, reports or flags, and operational alerts.

FR-73 Application and business administration

Status: FROZEN. Admin shall review applicant details, business information, documents, verification, history, and internal notes; approve, request information, or reject applications; and inspect business approval history, account status, listings, and relevant moderation or security history. Authorized suspension and reactivation shall be supported.

FR-74 Marketplace moderation and accountability

Status: FROZEN. Admin shall be able to inspect Packages, Services, and Offers, hide or suspend problematic listings, and record a moderation reason. Admin shall not impersonate a supplier or perform commercial actions as that supplier.

FR-75 System health view

Status: FROZEN. Admin shall have a safe high-level view of API, database, background job, notification, and messaging health. Sensitive engineering or infrastructure details shall remain outside ordinary Admin access.

MVP Product Boundary

Status: FROZEN. B2B Hyderabad is a specialized B2B marketplace and business collaboration platform. It shall not represent itself as Nusuk, a Saudi governmental authorization platform, or a substitute for official Saudi Hajj, Umrah, or visa systems.

Change Control

Status: FROZEN. Requirements in Sets 01, 02, 03, 04, and 05 shall not be silently altered. Any change requires explicit agreement and a recorded revision. Subsequent frozen requirement sets shall be appended as separately numbered sections.
